

# Nebb System Monitor

## Nebb System Monitor

Nebb System Monitor aims to predict incidents and notify system administrators before something happens. To prevent downtime it is critical that Potential errors is discovered as early as possible. Nebb System Monitor gathers data and analyses it to get a good picture of the health of a system.

### Monitoring capabilities

- CPU (%)
- RAM (%)
- Network (ping response time)
- HDD capacity
- Services and processes
- Windows Event logs
- Network routers/switches
- 3rd party application monitoring (logs, alarms, values)

### Configuration

Nebb System Monitor is delivered with a configuration tool, where one can add and delete nodes. A basic configuration is used for this purpose, which ensures the most common monitors and settings are in place.

## Reporting

- Built-in reporting capabilities
- Generate ad-hoc reports on different data
- Pre-defined reports generated periodically
- Send reports per e-mail
- Extend reports with reporting software already in use in the system

## Extensions

New extensions can be developed per request
